

QUALITY DECLARATION

The established quality system has its objective to guarantee the quality and safety of our products at the best possible prices while optimising the use of our resources as well as the proficiency and motivation of our team.

The Ventil Test units are designed to proof the quality of your new or reconditioned valve. The basic principle of testing is: absolute quality control, plant safety and environmental protection (emission control). To enable you to reach this goal, the Ventil test units are designed and manufactured with the best workmanship, based on 50 years of experience in valve technics and testing.

QUALITY ASSURANCE SYSTEM

The Ventil quality assurance system was certified according to ISO9002 by TUV in 1994. In the year 2000 we introduced the quality system according to ISO9001:2000. Ventil is currently also working on a complete service solution according to the ISO14001 standard. This total quality awareness is another assurance that Ventil's customers receive consistent, high quality products and service. Each and every Ventil test unit or accessory is thoroughly function tested prior to shipment.

DESIGN STANDARDS

Unfortunately no international recognized standard 'how to build a test unit' exists. Therefore we don't compromise and design- & build the Ventil test units according to the highest international safety and quality standards and machine directives. In 1995 Ventil began placing the CE mark on its entire product line by meeting all the criteria under the CE's machine directives. The CE mark denotes and adherence to special legalisation regarding worker health and safety.

DOCUMENTATION

Ventil only uses top quality products in its systems to assure the reliable working and guarantee efficient service in the future. All installed parts are tested and if applicable delivered with test- & calibration certificates. The delivery of the test unit always includes a well documented operation manual with detailed reference information, flow schedules, parts lists and certificates.

HEALTH AND SAFETY

At Ventil Test Equipment, we understand that good HSE management goes hand in hand with good business management and that safety is paramount to the continued success of the company. The management and supervision of Ventil Test Equipment are fully committed to achieving the highest possible standards; we seek to drive Health, Safety and Environmental standards higher at every opportunity.

Safety consciousness and a positive attitude is incorporated into all of our activities, the aim being to eliminate all work related injuries and illness to our employees and to cause no harm to the environment.

For and on behalf of;

VENTIL TEST EQUIPMENT B.V.
